Analyze CRISPRi growth competition data after treatment with or without Lysine

Ute Hoffmann (Science For Life Laboratory (KTH), Stockholm, Sweden)

januari 18, 2024

Contents

2	Ana	dysis
	2.1	Diagnostic plot to check if control sgRNAs look ok
		Add annotation to results tables
	2.3	Visualization
9	2.4	Gene set enrichment analysis

1 Aim of the analysis

Basic visualization of CRISPRi data for cultivation with lysine. Data analysis was performed using nf-core-crispriscreen pipeline (https://github.com/MPUSP/nf-core-crispriscreen).

2 Analysis

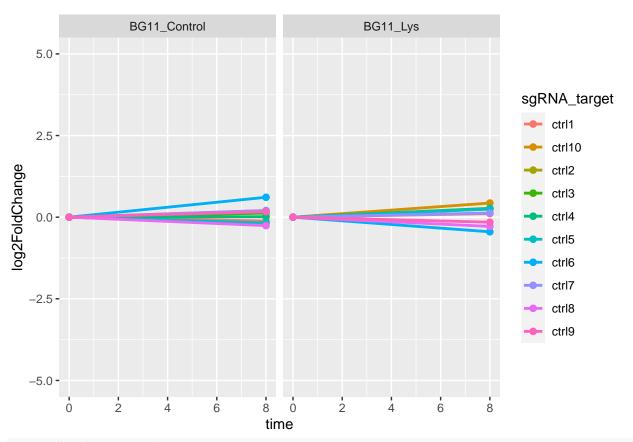

In a first step, the results given by the Nextflow pipeline are loaded.

```
load("../results/fitness/result.Rdata")
```

2.1 Diagnostic plot to check if control sgRNAs look ok

Several control sgRNAs are included in the CRISPRi library. These control sgRNAs do not target any specific gene and serve as a control. Here, all of them behave neutrally.

```
plot_controls_sgRNAs <- DESeq_result_table %>% filter(grepl("ctrl", sgRNA_target)) %>%
    ggplot(aes(x = time, y = log2FoldChange, color = sgRNA_target)) +
    geom_line(linewidth = 1) + geom_point(size = 2) + ylim(-5, 5) + facet_wrap(~ condition, ncol = 4)
print(plot_controls_sgRNAs)
```

ggsave(".../R_results/plot_control_sgRNAs.pdf", plot=plot_controls_sgRNAs, width=12, height=12, units="called blooms of the control of t

2.2 Add annotation to results tables

In the following, annotation is added to the results table provided by the Nextflow pipeline. Mapping of the sgRNA targets to slr-locus tags is given in this file, downloaded on 24/02/23: https://github.com/m-jahn/R-notebook-crispri-lib/blob/master/sgRNA_library_V2/data/input/mapping_trivial_names.tsv The appended annotation is based on Uniprot and Cyanobase, partially edited manually. The table used for annotation was created beginning of 2021. Therefore, it does not include several genes which were only recently characterized. For a detailed description of all the columns given in the results tables, consult https://mpusp.github.io/nf-core-crispriscreen/output or https://www.biorxiv.org/content/10.1101/2023.02. 13.528328v1.full.pdf+htmls

```
mapping_gene_locus <- read_tsv("../input/2023-02-24_mapping_trivial_names.tsv", show_col_types=FALSE)
names(mapping_gene_locus) <- c("sgRNA_target", "locus")
DESeq_result_table <- DESeq_result_table %>% left_join(mapping_gene_locus)
annotation <- read_tsv("../input/annotation_locusTags_stand13012021.csv", show_col_types = FALSE)
annotation_2 <- annotation[,c(1,2,3)]
names(annotation_2) <- c("locus", "Gene name","Product")
DESeq_result_table <- DESeq_result_table %>% left_join(annotation_2)
write_tsv(DESeq_result_table, file="../R_results/annotated_DESeq_result_table.tsv")
df_reduced_info <- unique(subset(DESeq_result_table, DESeq_result_table$time==8 | DESeq_result_table$time=tsv(df_reduced_info, file="../R_results/Reduced_annotated_DESeq_result_table.tsv")
df_red_wide <- pivot_wider(df_reduced_info, names_from=condition, values_from=c(wmean_fitness, sd_fitne)
</pre>
```

write_tsv(df_red_wide, file="../R_results/Wide_DESeq_result_table.tsv")

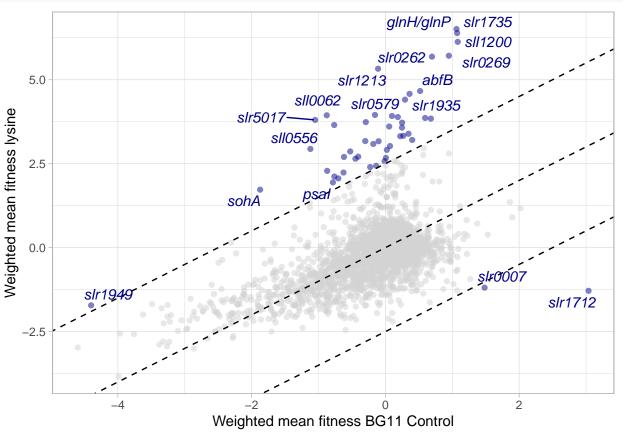

2.3 Visualization

The weighted mean fitness value combines the values of the different sgRNAs targeting the same gene. Fitness-fitness plots were created to identify genes which behave differently when lysine was added compared to the control cultivation. This was performed separately for ncRNAs and protein-coding genes.

2.3.1 Protein-coding genes

```
df_reduced <- unique(subset(DESeq_result_table, DESeq_result_table$time==8)[,c(2,4,20)])
df_red_ncRNAs <- subset(df_reduced, grepl("nc_", df_reduced$sgRNA_target))
df_red_no_ncRNAs <- subset(df_reduced, !grepl("nc_", df_reduced$sgRNA_target))
df_red_wide <- pivot_wider(df_red_no_ncRNAs,names_from="condition", values_from=c("wmean_fitness"))</pre>
```

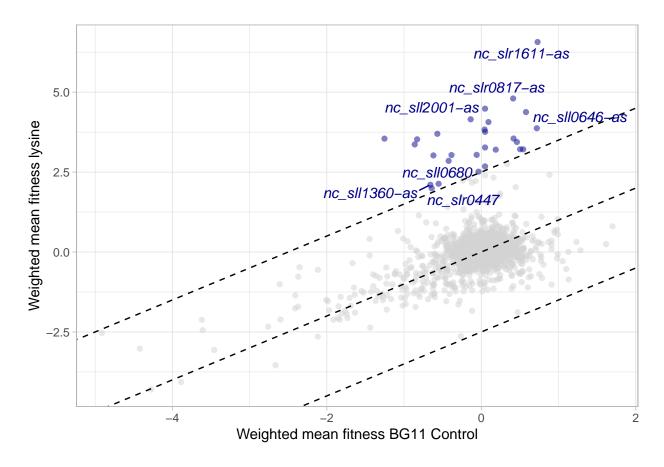

plot_fitness_fitness(df_red_wide, "BG11_Lys", y_axis_label="Weighted mean fitness lysine", filename_sav

2.3.2 ncRNAs

These include antisense RNAs, but also other ncRNAs.

```
df_red_wide_ncRNAs <- pivot_wider(df_red_ncRNAs,names_from="condition", values_from=c("wmean_fitness"))
plot_fitness_fitness(df_red_wide_ncRNAs, "BG11_Lys", y_axis_label="Weighted mean fitness lysine", filen</pre>
```

2.4 Gene set enrichment analysis

Functional enrichment analyses and gene set enrichment analyses help to check if a certain pathway or specific group of genes is especially affected by a treatment. Here, gene set enrichment analyses were performed for either Gene Ontology terms or KEGG pathways. To perform a gene set enrichment analysis, genes are sorted according to some measure, e.g. the log2FC after a certain time or the calculated fitness. Here, we used the weighted fitness of several sgRNAs as measure. The mapping of locus tags to Gene Ontology terms was downloaded from UniProt on the 18th Jan. 2024. There is the possibility to somehow weigh the adjusted p value in these calculation, e.g. by multiplying the weighted mean with the adjusted p value. Here, only the first few rows of each table is given. Full tables with all found terms/pathways are available.

In a first step, GSEAs were calculated for the control and the Lys-treated CRISPRi libraries separately. The depletion of essential pathways related to "Ribosomes" or "photosynthesis" is a first good quality measure for a CRISPRi screen.

2.4.1 BG11 Control, no amino acid added

GO:0031676 plasma membrane-derived thylakoid membrane

```
DESeq_result_table_control <- unique(subset(DESeq_result_table, DESeq_result_table$condition=="BG11_CongeneList <- DESeq_result_table_control$wmean_fitness
names(geneList) <- DESeq_result_table_control$locus
geneList = sort(geneList, decreasing = TRUE)
set.seed(513)
go_gsea_object <- GSEA(geneList, TERM2GENE = term_to_gene, TERM2NAME=term_to_name, seed=TRUE)
print(head(go_gsea_object)[,columns_to_show])

```

Results for the comparison of the two libraries were visualized. These plots are separated in three panels. The lowest panel ("Ranked List Metric") shows the metric according to which the genes were sorted. In this case, this was the weighted fitness mean associated with the different genes. The upper panel shows the running enrichment score of terms/pathways which were enriched/depleted in a statistically significant manner. The middle panel shows where the genes associated with these terms are located within the ranked list of genes in the same color code as used in the upper panel. It is worth mentioning that some GO terms,

such as "ATP binding", "cytoplasm" and "membrane" encompass gigantic gene sets. Same holds for some KEGG terms, e.g. "Biosynthesis of secondary metabolites" or "Biosynthesis of cofactors". I am personally always not quite sure how meaniningful it is if such huge sets are enriched or depleted.
